Nitrogen Blanketing Flow for Tank Pump-Out and Cooling

Nitrogen flow to hold the blanket pressure in a storage tank while it is pumped out and while its vapour space cools, as normal volume flow.

Method: Constant-pressure gas balance of a tank vapour space; Ideal gas law

Input parameters

Unit system: SI

Parameter	Value	Unit
Liquid pump-out rate	100.00	m³/h
Vapour space volume	500.00	m³
Cooling rate of the vapour space	10.000	°C/h
Vapour space temperature	30.000	°C
Blanket pressure (absolute)	101.83	kPa

Calculated results

Parameter	Value	Unit
Nitrogen for pump-out	90.549	Nm³/h
Nitrogen for cooling	14.935	Nm³/h
Total nitrogen flow	105.48	Nm³/h

Notes for this case

• Ideal gas at constant pressure: replace the liquid volume pumped out and the vapour-space shrinkage V·(dT/dt)/T, converted to 0 °C, 1 atm. Condensation of product vapour during cooling adds to this; codes for tank venting give design cooling rates.

Formula and method

$$\dot{V}_{N_2} = \left(Q_{out} + V_v \frac{\dot{T}}{T} \right) \frac{p}{p_n} \frac{T_n}{T}$$

Variables

Q_{out}	Liquid pump-out rate	m³/s
V_v	Vapour space volume	m³
$\dot{T}$	Cooling rate of the vapour space	K/s
T	Vapour space temperature	K
p	Blanket pressure (absolute)	Pa
$\dot{V}_1$	Nitrogen for pump-out	Nm³/s
$\dot{V}_2$	Nitrogen for cooling	Nm³/s
$\dot{V}_{N_2}$	Total nitrogen flow	Nm³/s

Method and standards

Blanket gas balance.

Assumptions and limits

- Ideal gas; uniform vapour-space temperature.
