Temperature Unit Converter (°C, °F, K, °R)

Convert a temperature between degrees Celsius, degrees Fahrenheit, kelvin and degrees Rankine, with the exact defining relations.

Method: SI Brochure (9th ed.) definition of the kelvin and degree Celsius; NIST SP 811 (2008); ...

Input parameters

Unit system: SI

Parameter	Value	Unit
Temperature (choose its unit)	37.000	°C

Calculated results

Parameter	Value	Unit
degree Celsius	37.000	°C
degree Fahrenheit	98.600	°F
kelvin	310.15	K
degree Rankine	558.27	°R

Notes for this case

- T(K) = T(°C) + 273.15; T(°F) = 1.8 T(°C) + 32; T(°R) = 1.8 T(K). A temperature difference converts without the offsets.

Formula and method

$$T_K = T_{\circ C} + 273.15, \quad T_{\circ F} = 1.8\,T_{\circ C} + 32, \quad T_{\circ R} = 1.8\,T_K$$

Variables

T	Temperature (choose its unit)	K

Method and standards

Exact scale definitions: the kelvin by the SI, the Celsius offset 273.15, and the Fahrenheit and Rankine degrees as 5/9 of a kelvin.

Assumptions and limits

- Absolute temperatures; for differences drop the offsets.

Report details

Report reference	FCC-710T-SVS7 (the same inputs always give the same reference)
Generated	17 November 2026, 19:54 UTC
Calculator	Temperature Unit Converter (°C, °F, K, °R)
Method last reviewed	12 November 2026
Software release	FireCAD Calc, release of 17 November 2026
Release checks	3 reference cases of this calculator, computed independently, are checked on every release

Results are for engineering estimation. Verify critical designs against the referenced standards and your own data.
